

COPPER COUPLING

Copper Couplings are straight connectors used to join two sections of copper tubing. Made from seamless DHP copper, sizes: ¼" to 4", with or without stops. Standards: ASTM B75/B88, EN 1254. Couplings allow solder, press-fit, or brazed joints in plumbing, gas lines and HVAC circuits. Their high durability and clean internal surfaces ensure excellent conductivity, long service life and low maintenance in water distribution, radiant heating and cooling systems.
