

# SPIRAL WOUND GASKETS

Spiral Wound Gaskets consist of a V-shaped metal strip (SS 304/316) and soft filler (graphite/PTFE), wound together for superior sealing. Available in sizes: ½" to 60", pressure class: 150–2500, conforms to ASME B16.20. Ideal for flange joints exposed to thermal cycling, vibration and high pressure. Used in refineries, chemical plants and boilers due to their resilience and ability to recover under load.
