

STAINLESS STEEL THREADED FLANGE

Threaded Flanges are used in low-pressure, non-welded piping systems, especially in explosive areas where welding is hazardous. These flanges have internal threads matching external threads on the pipe, allowing easy assembly. Manufactured in SS 304, 316, and other grades, available in sizes from ½" to 4", and conforming to ASME B16.5 standards with Class 150 to 600 pressure ratings. Widely used in fire protection, water treatment, and small-diameter chemical systems.
